2nd TASK

In predicting survival on the Titanic, several factors were influential. Socio-economic status, represented by passenger class, played a significant role, with higher-class passengers having better chances of survival. Age also mattered, as children and women were prioritized during evacuation. Gender was another factor, with women having higher survival rates than men. Additionally, being accompanied by family members or having access to lifeboats increased the likelihood of survival.

3rd TASK

In predicting survival on the Titanic, several factors were influential. Socio-economic status, represented by passenger class, played a significant role, with higher-class passengers having better chances of survival. Age also mattered, as children and women were prioritized during evacuation. Gender was another factor, with women having higher survival rates than men.
